*You have made a mistake*

The New Controlled-Key  
**COMPTOMETER**  
Enforces Accuracy

*For detailed information see inside pages.*

# Mechanical Calculations

*Further improvements have been made on the World's most accurate, most speedy, and most durable adding and calculating machine. The "Comptometer" by a series of inventions is now made proof against mis-operation.*

**I**T has taken twenty-eight years to bring the "Comptometer" up to its present state of excellence, though it has always been acknowledged to be the finest adding and calculating machine on the market.

Since 1909, when the "Comptometer" was first offered for sale in this country, many of the most progressive merchants in every trade have carefully tested its usefulness and have installed it in their offices. As a result of the economies effected by the machine and the increased efficiency which it has made possible, more than two hundred repeat orders have been received from British concerns alone.

## *Compels Correct Operation.*

**T**HE latest series of improvements have been made with a view to eliminating the least possibility of error. The old form machine itself cannot err ; if the keys are properly struck there is no possibility of an incorrect result ; but in this, as in all other machines not wholly automatic, there is a human element to be reckoned with—there is always the possibility that an inexperienced operator will not strike the keys in a proper manner. With the latest inventions which have been patented by us, the machine is made proof against mis-operation.

A clerk who has never operated the "Comptometer" before can use it with the certainty of getting correct results.

While drawing attention to these improvements, we invite the consideration of every merchant to the advisability of installing

## *Mechanical Calculations*

the "Comptometer" and displacing the old-fashioned expensive and inaccurate method of performing additions and calculations by mental process.

In every case where the machine has been installed it has effected great economies.

We shall be glad to supply full information to those firms who are interested in the "Comptometer" and the work it will do, and to give them the names of other concerns in their own business who have installed machines.

Every "Comptometer" in use to-day is saving money for its owners. We have no dissatisfied customers.

### *The Improvements.*

WHEN you make a mistake on the New "Comptometer," the "Controlled-Key" patent automatically prevents you continuing to further operate the machine.

Suppose, for instance, the inexpert operator touches the key in an indecisive fashion, that is, does not give it a full stroke, and therefore fails to register the correct figure, the "Controlled-Key" device immediately comes into action and automatically locks each key in every other column except the one in which registration has not been completed, and the operator cannot proceed until he has put right his mistake by giving the mis-operated key its full stroke. Then, by the simple depression of the release key, the whole machine is unlocked again.

### *Doubly Safe.*

THE second safety feature of the "Controlled-Key" is its automatic prevention of an incomplete upstroke. Should the operator when striking the same key twice or more in rapid succession, attempt to start it down again before letting it clear

## *Mechanical Calculations*

up, he will find it impossible to do so. Once the key has started up, it automatically locks against reversal at any point short of its full upward travel.

### *The Interference Guards.*

IT was formerly possible for an operator to fumble the keys, that is to say, for the fingers to slip from one key to another. On the new model "Comptometer," a key will only go down when it is touched squarely enough to first depress the key-top to a level with the Interference Guards (see page 8).

Thus it will be seen that errors from the accidental slipping of the fingers from one key to another are entirely eliminated on this new model machine.

### *Cushioned Key-Tops.*

THAT the comfort of the operator has not been overlooked in making these improvements is shown by the new key-tops. Keyboard operators are familiar with the discomfort attending constant contact of the fingers against firm unyielding key-tops. But this disagreeable sensation is entirely eliminated by the soft, easy touch of the cushioned key-tops of the New Model "Comptometer" (see page 8).

Knowing what the "Comptometer" is doing for those who are at present using it and believing that it will succeed on its merits, we have the fullest confidence that in the course of the next few years, every progressive firm in the United Kingdom having any considerable amount of calculating work will instal the new "Controlled-Key Comptometer," and we shall be glad to give any firm the fullest facility for

## *Mechanical Calculations*

inspecting the machine and testing it on their own work, free of charge.

The result of installing the machine will be to save money from the first moment. An inexperienced clerk can operate the new "Controlled-Key Comptometer," and within an hour will attain considerable speed and absolutely dependable results.

### *No up-keep Expense.*

**N**O expense other than the initial one of purchasing the machine is necessary. The new "Comptometer" can do the work of three or four clerks; it is always ready. It requires no supplies other than oil, and no expensive operator.

It entirely eliminates inaccurate figures, and makes it possible for all calculating work to be kept up-to-date, because operations are done with a rapidity that is almost instantaneous. The "Comptometer" is rapidly making friends amongst employers for whom it saves money and increases efficiency, and amongst employees who are relieved of a great volume of monotonous work which undoubtedly has a serious effect if persisted in for a length of time.

We shall be glad to have all readers of this little book consider the significance of the machine to themselves and to what extent it can enter into co-operation with them by helping perform the never-ending drudgery of all their calculations. The "Comptometer" adds, subtracts, divides and multiplies with unfailing accuracy and with greater speed than these operations can be performed by any other known method.

## The New "Controlled"

**T**HE machine is light, strong, compact, and 6 inches to top of keys; can be placed wherever may be most convenient. There is no carriage to attend to; no extra buttons, lever to pull—you merely press the keys and the machine requires no more physical effort than

FELT & TARRANT MFG. CO., 70 IMPERIAL

## "d-Key" Comptometer

and of the finest workmanship ; measures only  
ed on an open book or next to the work—  
e is no expense for paper or ribbon ; no  
ers, or keys to manipulate and no operating  
d read the answer. Actual operation of the  
an is needed to finger the keyboard.

IAL HOUSE, KINGSWAY, LONDON, W.C.

## The New Cushioned-Keys and Interference Guards

THE touch required to depress a key on the new model Comp-tometer is so light, consequent upon the introduction of the Cushion-keys, that several hours continuous work can be performed on the machine without any physical fatigue being felt by the operator.

The accidental slipping of the fingers from one key to another is entirely eliminated by Interference Guards which are provided at the side of each key and are to be seen in the illustration above.

# A Few Users of Comptometers

*(Many have several machines).*
